

How to Keep Your House Warm this Winter

Keep Curtains Closed at Night

Once the sun goes down, keep all that heat from leaving through the windows by closing the curtains. If you are based in a particularly cold home or location you could also consider getting insulated curtains.

TIP: Adding curtains to doors can also help keep the warmth in.

Close Doors on Bedrooms & Living Rooms

If you spend a lot of time in certain rooms like your living room or bedroom, then simply close the doors to these rooms to make a sauna like affect.

If you have big open spaces, you can use room dividers, it may not seem like much but any blockage that keeps air from escaping just a little less quickly will help keep the room warmer.

Install a Programmable Thermostat

This can help keep your heating bill low, and your efficiency high. Instead of having to manually fiddle with your thermostat every time you leave the house, you can set your heating to come at certain times. This is so your house can then be warm for you when you get home or even when you wake up on them cold mornings.

Seal Other Leaks

There can be air leaks in your home beyond the doors and windows. Attics and basements are the largest ones that you can think off. Sometimes even your kitchen hood vents can leak the hot air out of the home.

Sealing up these little or sometimes big hole with tape, rugs or insulation can ensure that you are losing the least amount of heat in your home.

Double or Triple Glazing

Double or Triple glazing keeps the warm air in, meaning your property is better insulated. This results in fewer draughts and cheaper heating bills.

They can also help reduce the amount of condensation on the inside of your windows.

Plus you get the added bonus of they keep the noise out as well as heightening security.

If you need help insulating your home this winter, then contact Framemaster to receive a free quote about double glazing windows and doors.
